LifeOS Reset Plan: Project Proposal

Nov 2, 2026 · @Deepthi

Overview

The Reset Plan becomes a 90-day program that the LifeOS agent runs with you: it builds the plan from a 3-step audit, checks in daily, reports every 15 days and every month, and tracks your goals through a linked Habit Tracker.

This proposal builds on the earlier Reset Plan section proposal (Nov 2, 2026), which defined the audit, the three monthly phases and the calendar mapping. Three things are new:

- **Agent-run months.** The agent handles the daily loop, drift checks and weekly rescheduling, and asks for your approval on every change to the plan or the calendar.
- **Reports and notifications.** A report with a notification every 15 days (six reviews), plus a monthly report on days 30, 60 and 90.
- **Habit Tracker link.** Every commitment and goal you set in the Reset Plan appears in a Habit Tracker, where the AI tracks progress against what you planned.

The build rule from the earlier proposal stays: everything is added behind switches (`RESET_PLAN_ENABLED` and `HABIT_TRACKER_ENABLED`), the agent proposes and the app decides, and calendar writes go through the existing calendar service.

Problem, goals and non-goals

90-day self-improvement programs usually fail because nobody checks on them: the plan lives in a note, the habits live in another app, and the review never happens. The Reset Plan fixes this by making the agent the one who keeps the loop running, while you stay in control of every change.

Goals

- The agent runs the day-to-day of the 90 days, and you spend about one minute a day on check-ins.
- Six 15-day review reports and three monthly reports arrive on schedule, each with a notification.
- Every commitment and goal from the plan appears in the Habit Tracker with no double entry.
- The AI tracks progress against what you planned, spots drift early, and proposes adjustments instead of silently changing the plan.

- With both flags off, LifeOS behaves exactly as it does today.

Non-goals (this version)

- Social or shared plans.
- Medical, therapy or financial advice, including advice on how to reach a money goal.
- Importing anything automatically from Instagram or other apps.
- The agent writing to the calendar or changing commitments without your approval.
- A full habit app: the Habit Tracker v1 covers habits, streaks and goal progress only.

How the 90 days work

The audit and plan happen once, then three monthly phases run back to back, with a review every 15 days. Day 1 is the day you approve the plan.

Phase	Days	Goal	What you set up	Daily rule
Setup	Before day 1	An honest starting point	3-step audit, gap report, draft plan you edit and approve	None
Month 1: Cut the excess	1 to 30	Drop what drags you down	Up to 3 things to give up	Same wake-up time, finish one task
Month 2: Foundation	31 to 60	Become consistent	Morning and evening routine, 3 daily non-negotiables	Do the 3 commitments
Month 3: Broaden horizons	61 to 90	Real growth	One goal each for finances, productivity and personal growth, plus challenges in discipline, responsibility and action	Keep the routine and work the goals

Audit and gap report. Three guided steps (where am I, where should I be, what happened), one question per screen, saved as you go. The agent compares step 1 with step 2 and drafts a one-screen gap report that quotes your own words. You edit it before anything is built.

Rules that keep it doable.

- At most 3 cuts, 3 non-negotiables and 3 goals at a time.

- Each commitment names an owner domain; finances use Forward planning until a Finance domain exists.
- Month 2 and Month 3 items stay hidden until the previous phase ends or you choose to start early.
- The plan is a draft first. Calendar events are created only after you approve, through the existing calendar service, and each batch can be undone in one step.
- Missing a phase target never locks you out; it only changes what the agent suggests.

How the agent runs the three months

The agent owns the rhythm of the program: it prompts, records, measures and proposes. You own the decisions. Each step below says whether your approval is needed.

When	What the agent does	Your approval needed?
Setup	Drafts the gap report from your audit, then proposes commitments for Month 1	Yes, you edit and approve before any event is created
Every evening	Sends the check-in reminder, records done, skipped or missed for each commitment, offers "move to tomorrow" or "drop for this week" on misses	Only for moves and drops
Every day (quiet)	Checks for drift: the same commitment missed 3 days in a row, or adherence under 50% over 7 days	No, it only raises a suggestion
Every Sunday	Adds one Reset card to the weekly review: adherence, missed blocks to reschedule into free slots	Yes, one tap to accept
Days 15, 30, 45, 60, 75, 90	Builds the review report, sends the notification, runs the notebook review	Yes, for the change you propose
Days 30 and 60	Proposes moving to the next phase, based on check-in rate	Yes, you confirm
Day 90	Builds the final report and offers a new cycle, a lighter pace or a pause	Yes

The drift thresholds above are starting defaults and can be tuned during the Week 4 test.

Autopilot level. A setting on the plan, with two choices:

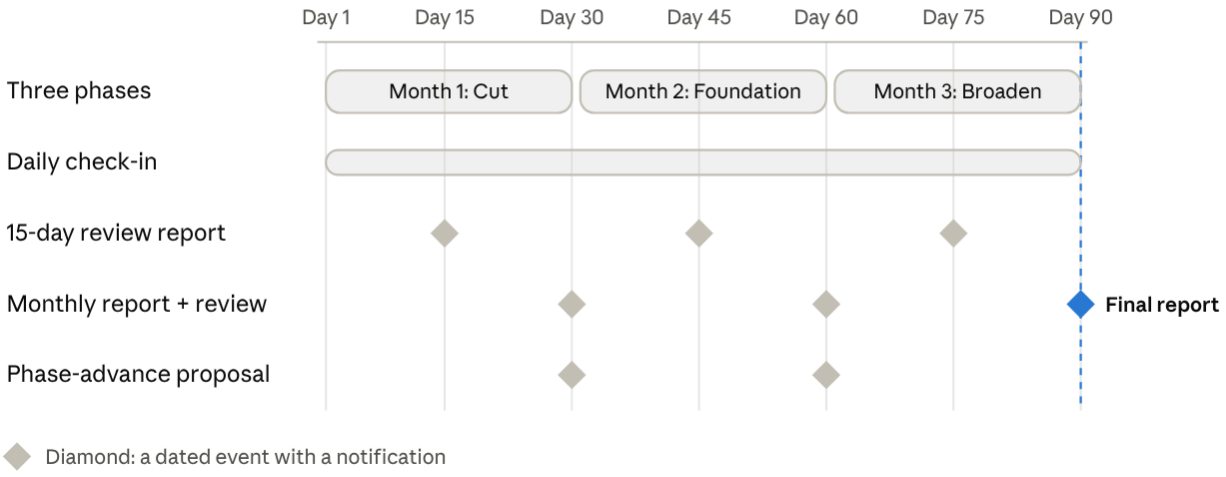

- **Suggest only (default).** The agent never changes anything on its own; every adjustment is a proposal.
- **Auto-adjust small things.** The agent may move one of your own Reset blocks to the next free slot in the same week, never into protected time, with an Undo button on the confirmation.

What the agent never does alone. It never creates new calendar events, adds or removes commitments, advances the phase, edits your notebook answers, or touches events that are not from the Reset Plan. Those always go through the approve button, which calls the calendar service.

15-day reviews and notifications

A review report arrives on days 15, 45 and 75, and the monthly report replaces it on days 30, 60 and 90.

A report lands every 15 days; days 30, 60 and 90 get the monthly one

report calendar · 90 days, 6 reviews, 3 monthly reports

On each review day the agent sends a notification, you answer the three black notebook questions in your own words, the agent builds the report, and any change you propose is saved only if you confirm it.

Each 15-day report contains

- Adherence for the last 15 days (done divided by planned) and your streak.
- The commitment you kept best and the one you missed most.
- The habit trend compared with the previous 15 days.
- Goal progress, from Month 3.

- Your three notebook answers: what have I done to get closer to the life I want, where have I shown weakness, what will I change tomorrow.
- A short agent summary, and the proposed change from your last answer as a task or calendar change.

Notification schedule

Notification	When	Text shown	Limits
Evening check-in	Daily, at the time you choose	"Your Reset check-in is ready"	Can be switched off
Review due	The morning of days 15, 30, 45, 60, 75 and 90	"Your day-15 review is ready"	Can be switched off
Review reminder	24 hours later, only if the notebook is not done	Same as above	One reminder only
Report ready	When the notebook is done and the report is built	"Your report is ready"	Can be switched off
Drift suggestion	When a drift check fires	"A suggestion for your plan"	At most one a day

Rules

- Reminders use the existing notification setup, and none of the text names a commitment or an answer.
- Pausing the program pauses every Reset notification.
- A review you skip on purpose counts as skipped, not missed. After 3 days with no response the agent offers to move or skip it.

Monthly reports

On days 30, 60 and 90 the 15-day review is folded into a monthly report, so you get one notification and one screen, not two. Each report is built from your check-ins, habit data and notebook answers, and every number can be traced to them.

Report	Day	What it shows	Decision it supports
Month 1: Cut the excess	30	Adherence for the month, streak, wake-up time consistency, how each cut held up, the commitment kept best and missed most	Move to Month 2, or stay in Month 1 for a while
Month 2: Foundation	60	Adherence vs Month 1, routine and non-negotiable results by domain, time-of-day patterns in misses	Move to Month 3, or lighten the routine
Month 3 and final	90	Goal progress in finances, productivity and personal growth, adherence across all three months, your gap report from day 0 next to where you are now, what stayed	Start a new cycle, keep a lighter pace, or pause

Every monthly report also includes:

- Your three notebook answers from that review, in your own words.
- One proposed focus for the next month, saved only if you confirm it.
- A short agent summary that quotes you and never invents facts about your life.

Tone rules. A missed commitment is shown as a count, never as a failure. Reports contain no diagnosis, no scores of your character, and no medical, mental health, legal or financial advice. You can edit or delete the summary, and export or delete the whole report from the Reset Plan page.

Habit Tracker link

The Habit Tracker turns what you plan in the Reset Plan into items the AI can follow day by day: plan in, tracking out, no retyping. It works on its own behind `HABIT_TRACKER_ENABLED`, and the link to the plan is active only when both flags are on.

The AI tracks what you planned, and only you can change the plan

Check-ins are written once, to ResetCheckin; the tracker only reads them.

plan to tracker loop · 4 parts, 1 approval step

The AI reads your check-ins and goal entries, and its output is always a proposal or a report. Changes to the plan go through your approval.

How plan items become tracked items

Reset Plan item	Shows in the Habit Tracker as	What the AI tracks
Cut (Month 1)	A "stop" habit	Days held vs days slipped
Anchor habit (same wake-up time, one finished task)	A daily habit	Done, skipped or missed; wake-up time vs target
Morning and evening routine (Month 2)	Two habits	Done rate by time of day
Non-negotiable (Month 2)	Up to 3 daily habits	Streak and adherence
Goal: finances, productivity, personal growth (Month 3)	A goal track with metric, unit, target and cadence	Progress against target, and pace towards day 90
Challenge: discipline, responsibility, action (Month 3)	A weekly habit	Weeks completed

Making a goal trackable. When Month 3 unlocks, the plan builder asks each goal for four things: a metric, a unit, a target and a cadence (for example, deep-work hours per week). Without them the goal stays on the plan but the AI cannot track it, and the builder says so.

How the AI tracks

- It reads only Reset check-ins, goal entries and the calendar events the plan created, not the rest of your calendar.
- Once a week, on the day you choose, it asks for the number for each goal track.
- It flags drift when a commitment is missed 3 days in a row, adherence stays under 50% for 7 days, or a goal falls behind the line towards its target.
- It responds with a suggestion and options: move to tomorrow, shrink the target, drop for the week, or switch to a lighter pace. You choose.
- Every number in the 15-day and monthly reports comes from the tracker, so the reports and the habit screens always agree.

Manual habits. You can also add habits that are not part of the plan. They are tagged as manual and appear in reports only if you include them.

Data model

The six tables from the earlier proposal stay as designed (ResetPlan, ResetAnswer, ResetReport, ResetCommitment, ResetCheckin, ResetNotebook). This version adds six more in a second additive migration. No existing LifeOS table is altered.

New table	Key fields	Purpose
ResetPeriodReport	id, plan_id, kind (review15, month), period_start, period_end, metrics, summary, edited_by_user, status	Stores each 15-day and monthly report
ResetNotification	id, plan_id, kind, due_at, sent_at, status (scheduled, sent, snoozed, off)	Drives reminders and report notifications
Habit	id, user_id, title, source (manual, reset_plan), commitment_id (optional), domain_id, cadence, status	One row per tracked habit
HabitEntry	id, habit_id, date, result, note	Entries for manual habits only
GoalTrack	id, commitment_id, metric, unit, target, cadence, status	The measurable form of a Month 3 goal or challenge
GoalProgress	id, goal_track_id, date, value, note	Progress points you log or confirm

Rules

- ResetPlan gains two settings, `autonomy` (suggest, auto_small) and `checkin_time`. It is a new table, so this alters nothing existing.
- Reset habits are written once, to ResetCheckin. The Habit Tracker reads them through `commitment_id`, so there is no double entry and no drift between the two.
- Every row carries the user, and every query filters by the logged-in user.
- Deleting a plan deletes its answers, report, check-ins, notebook entries, period reports, goal tracks and the habits it created, and removes only the calendar events it created.

Agent tools, safety and privacy

The model proposes and the app decides. No tool writes to the calendar; the approve button in the UI calls the calendar service, which runs the same conflict and protected-time checks as Chat.

Tool	Purpose	Status
reset_get_plan	Read the active plan, phase, commitments and today's check-in state	From earlier proposal
reset_draft_report	Build the gap report from saved answers, as a draft	From earlier proposal
reset_propose_commitments	Suggest commitments for the current phase, as a draft	From earlier proposal
reset_checkin	Record done, skipped or missed for a commitment	From earlier proposal
reset_notebook_summary	Summarize the last 15 days and propose a change	From earlier proposal
reset_build_report	Build a 15-day or monthly report draft from check-ins, habits and goal progress	New
reset_propose_adjustment	Propose a move, drop, lighter pace or phase change when drift is found	New
habit_get_overview	Read habits, streaks and goal progress, including those from the plan	New
goal_log_progress	Record a progress value for a goal you named	New

Scheduled jobs. Three cron endpoints, each protected by `CRON_SECRET` like the existing ones: `api/cron/reset-daily` (evening reminders and drift checks), `api/cron/reset-review` (15-day reports) and `api/cron/reset-month` (monthly reports).

Wellbeing guardrails

- If an answer shows serious distress or mentions self-harm, the agent pauses the program and all Reset notifications, responds with care, and encourages reaching out to someone trusted or a local support line.
- Plans are never framed as the cure for a hard period; the app offers a lighter pace instead.
- Beyond the evening check-in, the agent sends at most one nudge a day, and every notification type can be switched off.
- The audit, the program and any report can be skipped, paused or deleted at any time.

Privacy

- Answers, reports and goal data are stored per user, with access limited to that user.
- A setting controls whether your answers are sent to the AI model. When it is off, reports contain numbers only and you write the summary yourself.
- Notifications show generic text such as "Your Reset check-in is ready", never your commitments or answers.
- Goal tracking records the numbers you enter. It gives no financial, medical or legal advice.

Screens

The section has twelve screens. Two cards sit at the top of the Domains grid, Reset Plan and Habit Tracker, each shown only when its flag is on. The existing 12 domain cards are unchanged, and everything follows the existing design: same colors, cards, animations and bottom navigation.

Screen	What it shows	New in this version
Intro	What the Reset Plan is, how long it takes, privacy note, Start	No
Audit	One question per screen, progress bar, save and continue later	No
Gap report	Now vs should-be, top gaps, patterns, cut and anchor candidates, all editable	No

Screen	What it shows	New in this version
Plan builder	Commitments by phase with owner domain and schedule; Approve writes calendar blocks	No
Plan home	Phase, day count, today's commitments with one-tap check-in, streak, adherence ring, next review date	No
Notebook	The three review questions, agent summary, proposed change to confirm	No
Finish	Day-90 results and the choice to start a new cycle or pause	No
15-day review report	Adherence, best and most missed commitment, habit trend, your notebook answers, proposed change	Yes
Monthly report	Month comparison, goal progress, phase-advance proposal, final before/after on day 90	Yes
Habit Tracker	Habits with streaks, goal tracks with progress, filters for plan habits and manual habits	Yes
Goal detail	Metric, target, progress chart, notes, one-tap progress entry	Yes
Reset settings	Check-in time, notification toggles, autopilot level, send-answers-to-AI switch, export and delete	Yes

Every screen works one-handed on a phone with 44px touch targets, and empty, loading and error states follow the existing app. The Today and Calendar screens stay untouched; plan blocks appear as normal events through the calendar service.

Build plan

The build takes 5 weeks, from Mon Jan 25 to Sun Feb 28, 2027, starting after the full LifeOS system lands on Jan 24 (assumed; shift every date if you start earlier or later). Each week ends with something you can use.

Week	Dates	Build	Done check
1. Foundation and audit	Jan 25 to 31	Both flags, first migration (six tables), Domains card, Intro and Audit screens with save-as-you-go	Answer all three steps, close the app, reopen and continue
2. Report and plan	Feb 1 to 7	reset_draft_report, editable gap report, reset_propose_commitments, plan builder with the 3-item limits, Approve through the calendar service	Approve a plan, see events in the right domain colors, undo the whole batch
3. Daily loop and notifications	Feb 8 to 14	Plan home, one-tap check-ins, streak and adherence, ResetNotification, evening reminder, api/cron/reset-daily with drift checks	Simulate 10 days of check-ins; reminders arrive once, drift is flagged correctly
4. Reviews and monthly reports	Feb 15 to 21	Notebook screen, reset_build_report, 15-day report, monthly report, api/cron/reset-review and reset-month, phase-advance proposals, autopilot setting	Simulate 90 days of data; all six reviews and three monthly reports are correct and notify on time
5. Habit Tracker, safety, regression	Feb 22 to 28	Second migration, Habit Tracker screens, goal tracks, habit_get_overview and goal_log_progress, wellbeing pause, export and delete, polish	Plan habits and goals appear with no re-entry; regression checklist passes with flags on and off

Regression checklist (nothing else may change)

- With both flags off, Domains, Today, Calendar and Chat behave exactly as before.
- All 12 existing domain cards and agents work unchanged, and existing chat commands (move, add, lighten, summary) give the same results.
- Protected-time confirmation and undo still work for non-Reset changes.
- Deleting a Reset Plan removes only its own data, events and habits.
- Cron endpoints reject requests without CRON_SECRET.

Acceptance. One real person completes the audit, runs two weeks of check-ins, finishes a 15-day review and a monthly report, and sees the same commitments in the Habit Tracker and the calendar the whole time.

Risks and success measures

The biggest risk is tone: a "no sugarcoating" audit and a stream of reports can slide into shame or nagging, so the app is built to be honest without being harsh.

Risk	Mitigation
The audit or reports feel harsh	Kind-but-honest prompt rules, no failure labels, skip and pause at any time
Notification fatigue	Evening check-in plus at most one nudge a day, every type can be switched off, quiet hours
The AI summary invents facts	Summaries quote your words, numbers come only from check-ins and goal entries, you can edit or delete
Plan overload	Hard limit of 3 per type, phases unlock in order
The agent changes things you did not expect	Suggest-only by default, auto-adjust limited to moving your own Reset blocks, Undo on every change
Goal tracking drifts into financial advice	Tracks only numbers you enter, prompt rules refuse advice and point to a professional
Habit Tracker and plan disagree	Reset habits are written once, to ResetCheckin, and only read by the tracker
Sensitive answers about money, emotions and health	Per-user access, a switch for sending answers to the AI, generic notification text, export and delete
Existing features break	Additive migrations, two flags, regression checklist run with flags on and off
The program is dropped after two weeks	One-minute check-ins, gentle reminders, a lighter-pace option

Success measures (first 90 days of real use)

- At least 5 of 7 days checked in during the first phase.
- At least 5 of 6 notebook reviews completed or consciously skipped, and all three monthly reports opened.
- Plan adherence of 70% or more by the end of Month 2.

- 100% of Reset commitments and goals visible in the Habit Tracker with no manual re-entry.
- At least one goal in each of finances, productivity and personal growth set by Month 3.
- Zero reported changes to existing screens when the flags are off.
