LifeOS: 21 Domains and Their Knowledge Systems

Nov 7, 2026 · @Deepthi

Overview

LifeOS now has 21 domains: the 12 core domains, the 6 suggested ones, and three new ones (Prayer, Medicine, Mood reflections). This document gives each domain the knowledge systems it needs to act like a specialist, plus one unique system that only that domain has.

What a knowledge system is. A domain's own rules, vocabulary, data structures and templates, so the agent plans with expert structure instead of generic calendar blocks. Each one is built from the same parts: a data model, rules the calendar service enforces, templates or playbooks, and metrics for reports. Example: Education knows what a syllabus, an exam weight and a revision interval are; Sleep knows what sleep debt is.

How each domain is written.

- **Knowledge systems:** the structured knowledge the domain needs to work.
- **Unique system:** one inventive feature built on top of it, which also links to other domains.

All systems follow the existing rule: the agent proposes, the app validates through the calendar service, and every change can be undone.

The 21 domains at a glance

The domains fall into five clusters, which also decide the order of the sections below.

Cluster	Domains	Count
Study and work	Career, Education, Competitions, Learning, Open source, Blogging, Portfolio	7
Body and health	Sleep, Food, Karate, Medicine, Rest and buffer	5
Mind and spirit	Prayer, Mood reflections, Habits and reflection, Forward planning	4
People and service	Volunteering, Social and mentors	2
Life admin	Finance, Admin, Travel and commute	3

Origin of each domain: 12 core (Career, Education, Competitions, Volunteering, Open source, Food, Sleep, Karate, Blogging, Learning, Forward planning, Rest and buffer), 6 suggested (Finance, Admin, Social and mentors, Portfolio, Travel and commute, Habits and reflection), and 3 new (Prayer, Medicine, Mood reflections).

Shared knowledge layer

Every domain is built from the same eight parts, so a new domain is mostly configuration. The domain sections below only describe what is specific to each one.

Part	What it holds	Where it lives
Domain config	Name, color, goals, protected tier, default event types	Domain table and config file
Vocabulary	The domain's own terms and event types (exam, shift, dose, kata)	Domain config
Rules	Constraints the calendar service enforces (minimum sleep, fixed prayer times)	lib/calendar
Playbooks	Templates the agent fills (revision plan, pitch sprint, packing list)	One prompt file per domain
Domain data	Typed tables for the domain (applications, doses, hours ledger)	New tables per domain
Memory	Notes and past decisions, recalled by similarity	pgvector Memory table
Metrics	What the domain reports (adherence, hours, streaks)	Weekly and Reset reports
Safety	What the agent must not do or must confirm	Domain prompt and tool rules

Study and work

These seven domains share one idea: every output (a job application, a hackathon result, a pull request, a post) becomes evidence that feeds Career and Portfolio.

Career

- **Knowledge systems:** application pipeline (saved, applied, screen, interview, offer); CV version library with a tailoring log; networking contact log with follow-up dates; interview question banks by role.
- **Unique: Skill-gap radar.** Compares the skills named in your target job posts with your Learning logs and Portfolio evidence, then books learning blocks for the biggest gaps.

Education

- **Knowledge systems:** syllabus topic tree per course; exam countdown with spaced revision intervals; assignment weights and a grade calculator (what score you need to hit a target); lecture timetable; past-paper log.
- **Unique: Mastery map.** Each topic carries a confidence level updated from practice results, so revision blocks go to weak and fading topics first instead of being spread evenly.

Competitions

- **Knowledge systems:** competition calendar with rules and eligibility; team roster and role board; submission checklist (deck, demo, repository, form); pitch rehearsal log; post-mortem notes.
- **Unique: Reverse sprint.** Counts back from the submission time to place build freeze, demo recording and buffer slots, then scores your pitch draft against the published judging rubric.

Learning

- **Knowledge systems:** skill roadmap with prerequisites; resource library with status; daily learning block; project practice log; spaced review of your own notes.
- **Unique: Skill tree.** The roadmap is a graph where nodes unlock when prerequisites are done; the agent picks the unlocked node that best serves your current Career and Education goals.

Open source

- **Knowledge systems:** repository watchlist; issue and pull request tracker with status; contribution guidelines summary per project; weekly contribution slot; contribution streak.
- **Unique: Issue fit scorer.** Ranks open issues by match to your skills, estimated hours and how quickly maintainers respond, then reserves a slot for the best one. Live issue data needs the later GitHub sync; until then you enter issues by hand.

Blogging

- **Knowledge systems:** idea to draft to edit to publish board; editorial calendar; outline templates by post type; publishing checklist; reuse library of finished posts.
- **Unique: Idea harvester.** Scans the week's learning notes, competition post-mortems and merged pull requests, proposes post ideas, and places writing slots in your focus hours.

Portfolio

- **Knowledge systems:** project list; evidence log (certificates, results, outputs, links); case-study template; skills-to-evidence map; public and private visibility per item.
- **Unique: Evidence auto-capture.** A finished competition, merged pull request, volunteer milestone or published post proposes its own Portfolio entry, and an application kit turns chosen evidence into tailored CV or scholarship bullets.

Body and health

These five domains hold the protected time. Medicine is the strictest: it records and reminds, and it never advises.

Sleep

- **Knowledge systems:** sleep window and minimum; sleep debt calculator; wind-down routine; focus hours from your own chronotype; schedule-shift planner for exam weeks, travel and fasting periods.
- **Unique: Sleep debt bank.** Every short night is a debt the planner repays by lightening the next days, and any change that would push sleep under your minimum is blocked until you confirm.

Food

- **Knowledge systems:** protected meal windows; weekly meal plan; grocery list built from the plan; prep scheduling; your own dietary restrictions and preferences; hydration reminders. No calorie or weight targets by default.
- **Unique: Prep-once planner.** Matches meals to your week: heavy exam or training days get zero-cook meals, and batch-cooking sessions are placed on the lightest days. A fasting-aware mode shifts meal windows when Prayer or Medicine requires it.

Karate

- **Knowledge systems:** class and training calendar; technique and kata syllabus by belt; grading requirements and dates; conditioning plan with recovery days; injury note that caps training load.
- **Unique: Belt path.** Breaks the next grading syllabus into weekly drill blocks counted back from the grading date, and tapers load before a tournament linked from Competitions.

Medicine

- **Knowledge systems:** medication schedule entered from your clinician's instructions; refill countdown; appointment and follow-up tracker; symptom and side-effect log; vaccination and checkup dates; questions-for-the-doctor list.
- **Unique: Dose-safe scheduler.** Dose times are fixed anchors that other domains must plan around; the agent never moves one without confirmation. A visit brief turns your logs into a one-page summary before each appointment.
- **Boundary:** no diagnosis, no dosing advice. Interaction warnings come only from a licensed drug database and always say to ask a pharmacist or doctor.

Rest and buffer

- **Knowledge systems:** protected downtime; automatic buffer rules between blocks; daily load limit; deload weeks; one true day off.
- **Unique: Recovery forecast.** Combines planned load, sleep debt and mood trend to show burnout risk for the coming week, and proposes extra buffer before the week starts, not after.

Mind and spirit

These four domains are private by default and shape how the other domains plan. Prayer and Mood reflections follow the sensitive-domain rules in a later section.

Prayer

- **Knowledge systems:** a tradition profile you set yourself, so the domain is not tied to one faith; prayer or worship times computed from your location and the calculation method you pick; a calendar for your tradition's special days and fasting periods; reading or recitation plans; reminders for gatherings.
- **Unique: Moving anchors.** Prayer blocks are anchored to the sun (sunrise, midday, sunset) instead of a clock time, so they shift daily and the planner re-checks every other block against them. Fasting periods automatically notify Food and Sleep.

Mood reflections

- **Knowledge systems:** quick check-in on mood and energy (1 to 5); an emotion vocabulary list to name feelings; context tags (people, place, activity); journaling prompts; weekly pattern view.
- **Unique: Private weather map.** Shows how your mood and energy line up with sleep, training, workload and time outdoors, so you can see what lifts or drains you. An optional gentle mode proposes a lighter tomorrow, which you approve.
- **Boundary:** not therapy and not a diagnosis. If an entry shows serious distress or mentions self-harm, the agent pauses planning prompts, responds with care and points to someone you trust or a local support line.

Habits and reflection

- **Knowledge systems:** habit list with cadence; daily check-in; streaks; weekly reflection prompts; energy notes. This is the Habit Tracker from the Reset Plan proposal.
- **Unique: Streaks with grace.** You set how many skips a week do not break a streak, so one bad day does not erase progress. The agent suggests habit stacking: attaching a new habit to one you already keep.

Forward planning

- **Knowledge systems:** yearly direction per domain; monthly goals; weekly review templates; decision journal; the Reset Plan program.
- **Unique: Life compass.** Each domain gets a stated intent, and the weekly review compares the hours each domain actually received with that intent, then proposes rebalancing. The decision journal stores your prediction for each big choice so you can check it later.

People and service

Volunteering

- **Knowledge systems:** shift scheduler; hours ledger per organization and month; role and skills log; certificate and reference tracker; short impact notes after each shift.
- **Unique: Impact ledger.** Turns logged hours and notes into a shareable impact summary for your CV and scholarship applications, and warns when volunteering hours crowd an exam or competition week.

Social and mentors

- **Knowledge systems:** people list with relationship type; contact rhythm you choose per person; birthdays and events; mentor session agenda and notes; thank-you tracker.
- **Unique: Relationship rhythm.** Gentle nudges appear only when a gap passes the rhythm you set yourself. Before a mentor session, a prep sheet gathers your progress since last time from other domains, and only the items you approve are included.

Life admin

Finance

- **Knowledge systems:** budget categories; expense log; scholarship, prize and stipend tracker with deadlines; savings goal tracker; subscription and renewal list. It also holds the finance goals from the Reset Plan. No investment, tax or other financial advice.
- **Unique: Funding radar.** Every scholarship or prize deadline turns into backwards-planned work blocks (essay, documents, review), and a monthly view shows which deadlines are covered and which are not.

Admin

- **Knowledge systems:** register of forms, fees and renewals; document index (names and expiry dates, not the files); deadline ladder at 30, 14, 7 and 1 days; appointment queue; checklist templates.
- **Unique: Paper-trail builder.** From a task like "apply for a course", the agent builds the list of required documents with their lead times and schedules each one backwards from the deadline.

Travel and commute

- **Knowledge systems:** commute times per route; automatic buffer between places; trip itineraries; packing lists by trip type; time zone handling.
- **Unique: Door-to-door blocks.** Any event with a location gets travel and buffer blocks inserted around it, so the calendar shows the real time cost, and a packing list is generated from the trip type and the days away.

Cross-domain systems

Five systems connect the 21 domains so the agent plans one life, not 21 separate calendars.

System	What it does	Domains it ties together
Protected tiers	Ranks what the planner defends: tier 1 fixed anchors (Medicine doses, Prayer times, Sleep minimum), tier 2 protected (meals, Karate, Rest), tier 3 flexible. You set the order.	Medicine, Prayer, Sleep, Food, Karate, Rest and buffer
Energy budget	Gives each day an energy budget from sleep, mood and load, and shows what each block spends.	Sleep, Mood reflections, Rest and buffer, all planning domains
Season profiles	One-tap modes (exam season, competition week, fasting period, travel week) that switch rules across domains at once, such as shorter blocks and extra buffer.	Education, Competitions, Prayer, Food, Travel and commute
Life graph	Links events, tasks, notes and goals across domains, so the agent can answer "why is this block here" and spot clashes.	All 21
Evidence loop	Finished work in one domain proposes entries in Portfolio, Career and Blogging, which feed back into Learning goals.	Competitions, Open source, Volunteering, Learning, Portfolio, Career, Blogging

The weekly review adds a balance wheel: hours each of the 21 domains actually received against the intent set in Forward planning.

Safety and privacy for sensitive domains

Medicine, Mood reflections and Prayer hold the most personal data in LifeOS, so they share a stricter set of rules.

- **Opt-in.** Each domain is off until you turn it on, and each has its own switch for whether its content may be sent to the AI model. When that switch is off, the domain still works as a calendar and log, and the agent sees only the time blocks.
- **Generic notifications.** Alerts say "Time for your 8 PM reminder", never the medicine, the mood or the prayer.

- **No advice.** The agent gives no diagnosis, no dosing advice and no religious rulings. It records, reminds, summarizes your own entries and suggests asking a professional or your community.
- **Kept out of other reports.** Reports, mentor prep sheets and the Reset Plan reports include nothing from these domains unless you choose to include it.
- **Care first.** Serious distress or any mention of self-harm in Mood reflections or elsewhere pauses planning prompts, and the agent responds with care and encourages reaching out to someone you trust or a local support line.
- **Export and delete.** Each domain can be exported or deleted on its own, and deletion also removes its embeddings from memory.

Rollout order

The domains roll out in four waves, each reusing the template from the wave before. The sensitive domains come last because they need the privacy switches and safety rules in place first.

Wave	Domains	Why this order
1. Prove the pattern	Education, Competitions, Karate, Sleep	The four MVP domains; they set the protected-time and auto-scheduling rules
2. Remaining core	Career, Volunteering, Open source, Food, Blogging, Learning, Forward planning, Rest and buffer	Each is a config, a prompt file and its own tables
3. Suggested	Finance, Admin, Social and mentors, Portfolio, Travel and commute, Habits and reflection	Portfolio and Habits unlock the evidence loop and the Reset Plan link
4. Sensitive	Medicine, Prayer, Mood reflections	Need the opt-in switches, generic notifications and distress handling first; they also add tier 1 anchors to the planner

The cross-domain systems arrive with the wave that needs them: protected tiers in wave 1, the life graph and season profiles in wave 2, the evidence loop in wave 3, and the energy budget in wave 4, once mood data exists.
