LifeOS Addendum: Prayer Update and Period Tracking

Nov 9, 2026 · @Deepthi

Overview

This addendum makes two changes to LifeOS.

1. **Prayer is updated.** Prayer times are entered by you instead of being computed, the five daily prayers (Fajr, Dhuhr, Asr, Maghrib, Isha) each get a one-tap check-in, and a GitHub-style graph shows how many you completed each day.
2. **Period tracking is added as a new domain.** It records your cycle, predicts the next one as a range, and connects to the other sections so the planner can take it into account when you choose.

With Period tracking, LifeOS has **22 domains**. It joins Body and health, which now holds 6 domains.

What stays the same. Everything is private by default, opt-in, and off until you turn it on. The agent proposes and you approve, every change goes through the calendar service and can be undone, and notifications use generic text. Both domains record and remind; they give no religious rulings and no medical advice.

Prayer: times you enter

The app no longer computes prayer times. You enter the start time of each of the five prayers, and everything else (anchors, reminders, windows, stats) works from those times.

Entering times

- **Weekly grid.** A table with one row per prayer (Fajr, Dhuhr, Asr, Maghrib, Isha, plus an optional Sunrise row) and one column per day. Tap a cell to set the time.
- **Shortcuts.** Copy yesterday, repeat this week, shift all times by a number of minutes, or paste a timetable (for example from your mosque) and let the agent fill the grid; you review it before it is saved.
- **Chat.** "Maghrib is 5:42 today" or "Isha at 8:15 for this week" updates the grid.
- **Running low.** Times change slowly, so you can enter a week or a month at a time. A reminder arrives 3 days before the last entered day, and if a day has no times the app uses the most recent entered day and says so.

Windows. A prayer's window runs from its start time to a time you choose: by default the start of the next prayer, and for Fajr the Sunrise time if you entered one. You can change where each window ends in Settings; the app does not decide this for you.

On the calendar

- Each prayer becomes a tier 1 anchor: a short block at its start time (you set the length, for example 15 minutes) with a soft band for the window.
- The planner places everything else around them, and asks before any change that would overlap one.
- Reminders arrive at the start and a chosen number of minutes before the window ends, with generic text.

Travel. Prayer times are yours to update. When your timezone changes, the agent asks whether to keep the same times or enter new ones.

Prayer: check-ins and GitHub-style stats

Check-in. Each of the five prayers has its own one-tap check-in on Today and in the notification. It is created once per prayer per day and stored on that day's record, so "Mark all as read" never changes an answer.

Status	Meaning	Counts as done
On time	Marked during its window	Yes
Late	Marked after the window ended	Yes by default (a setting lets you turn this off)
Missed	Not prayed; shown neutrally with an optional "make up" note	No
Excused	Not required that day (for example, when Period tracking is linked and you turn that link on)	Neither done nor missed; the streak is not broken

An optional tag marks a prayer as in congregation.

Year heatmap. One square per day in the Prayer color (orchid), in rows of 7 days and columns of weeks, like the GitHub contribution graph.

Prayers done that day	Shade
0	Empty square with a faint border

Prayers done that day	Shade
1 to 2	Lightest
3	Light
4	Strong
5	Full color

Excused days show an outlined square with a small dot, so they are visible and never look like gaps. Days before you started are blank. Tapping a square opens that day's five prayers with their statuses, and you can edit them.

Numbers beside the graph

- Current streak of days with all five, longest streak, and days with all five this month.
- Done this week out of 35, and this month.
- On-time rate per prayer over the last 30 days, with the strongest and the one with most room to grow, in kind wording.
- A separate Fajr streak, if you want it.

Other views. Today shows five dots that fill as you check in. A per-prayer view shows five rows (Fajr to Isha) by day, which makes patterns easy to see, such as Fajr after late nights.

Calm by design. Streaks and scores can be hidden in Settings. Nothing is shared, and nothing appears in weekly reviews or reports unless you include it.

Period tracking domain

Purpose. A private log of your cycle that predicts the next period as a range and lets the planner and other domains adapt, only where you allow it.

What it records

- **Start and end dates.** One tap on "Period started today" and "Period ended", or a chat message such as "period started yesterday".
- **Daily log (optional).** Flow level (spotting, light, medium, heavy), symptoms from a list you choose, pain on a 1 to 5 scale, energy, and a short note.
- **Medication taken.** Linked to the Medicine domain, not stored twice.

How predictions work

1. A cycle length is the number of days from one start date to the next.
2. From the last 6 cycles, the app takes the average and the range from shortest to longest.

3. The next start is shown as a range, from the last start plus the shortest cycle to the last start plus the longest, with the average marked as the most likely day.
4. With fewer than 3 cycles, the range is wide and labeled "needs more data".
5. The expected length of the period is the average of your last 6.
6. If your cycles vary a lot, the app says predictions are rough. It never labels that as a condition.
7. If the range passes without a start, the message is neutral. If something feels worrying, the app suggests talking to a doctor.

Reminders. An optional heads-up a number of days before the predicted range, and an optional daily log prompt while a period is active. Both use generic text.

Insights (private). Cycle length trend, how often each symptom is logged, and a one-page summary you can take to an appointment, built from your own entries.

What it never does. It is not a medical device, and it gives no diagnosis, no pregnancy, fertility or contraception advice, and no treatment advice. It stores and shows what you enter and simple averages of it.

Connections to other sections

Each link has its own switch and is off until you turn it on. When a link changes another screen, that screen shows only the result (for example "lighter day") and never the reason, unless you choose to show it.

Section	What the link does
Prayer	Days you mark as excused show as Excused, not Missed, and do not break your streak. Make-up days for missed fasts can be tracked if you use Ramadan mode.
Sleep	On days you choose, the sleep goal can be raised by a set amount, and a short night counts less towards sleep debt.
Energy budget	Marked days start with a lower or higher budget, set by you, so the planner suggests fewer blocks.
Mood reflections	The weekly pattern view can overlay cycle days, so you can see how mood and energy line up.

Section	What the link does
Medicine	Medication taken appears in both places from one entry, and your symptom log goes into the visit brief for appointments.
Food	Your own preferred meals can be suggested for chosen days, and prep-heavy tasks move to other days. The app gives no nutrition advice.
Karate and training	The planner can propose swapping hard sessions for light ones on days you choose; you approve it.
Rest and buffer	Extra buffer is added around chosen days, and the recovery forecast reads the log.
Habits	Selected habits can pause or soften their targets on chosen days, and streaks use grace days.
Calendar	A soft band shows the predicted window, visible only to you, and an optional "gentle days" season profile lightens the week.
Reset Plan	A lighter pace can be offered, and days in the window never count as missed commitments.
Education	If an exam falls inside the predicted window, you get a private note to plan around it.
Travel and commute	A trip that overlaps the predicted window can add items to the packing list.
Weekly review	A private line about cycle and workload, off by default.
Notifications	The heads-up and log prompts use generic text and respect quiet hours.
Diary	An entry can be linked to a cycle day.
Today	An optional small card, hidden by default, showing the cycle day or the predicted window.

Data and rules

All new tables are additive, carry the user, and are filtered by the logged-in user.

Table	Key fields	Purpose
PrayerTime	user, date, prayer, start time	The times you enter, plus an optional sunrise
PrayerSetting	window end rules, anchor length, reminder offsets, count late as done	Your choices for windows and reminders
PrayerLog	user, date, prayer, status, in congregation, logged at	One row per prayer per day; unique on user, date and prayer
CycleEntry	user, date, flow, pain, symptoms, note	Daily log
Cycle	user, start date, end date	One row per period, derived from entries
CycleSetting	link switches, reminder lead time, daily prompt on or off	Which connections are on

Rule functions (plain, tested code)

- `prayer_window` (start to the end you chose), `prayer_checkin_once` (no duplicate per day and prayer), `heatmap_level` (0 to 5 from done count), `streak_all_five`, `excused_day`.
- `cycle_lengths`, `predict_range` (shortest to longest of the last 6), `period_length_avg`.
- `apply_cycle_links` (reads only the switches you turned on and returns adjustments such as a sleep goal change or a lighter-day suggestion).

Agent tools. `prayer_set_times`, `prayer_checkin`, `prayer_stats`, `cycle_log`, `cycle_predict` (read only) and `cycle_set_link`. No tool writes to the calendar directly; any proposed change goes through the approve button and the calendar service.

Edge cases to test. Daylight saving changes in the entered times, a prayer window crossing midnight (Isha to Fajr), a check-in made after the window, editing a past day, a cycle with a missing end date, and a first cycle with no history.

UI and UX design

Both pages use the shared domain page layout from the Domain Design Guide: header wash, hero ring, signature element, tabs and one violet primary action.

Part	Prayer	Period tracking
Color and icon	Orchid #D17FF5, sunrise (unchanged)	Ruby #D6336C, droplet (the 22nd domain color; run the neighbor test against Mood and Habits, which are lighter pinks)
Cluster	Mind and spirit	Body and health
Personality	Calm, reverent, minimal	Gentle, private, discreet
Hero	Today's count out of 5 in a ring	Cycle day in a ring, or "window expected in 4 to 8 days"
Signature element	Five anchors along the day and the year heatmap with the numbers beside it	Cycle ring with the predicted window as a soft arc, and a month strip of logged days
Quick action	Five dots on Today, one tap each	"Period started today" and a flow chip row in a bottom sheet
Motion	A dot fills softly; the heatmap square for today fades in; no celebration	The ring turns slowly into place; the drop fills; no celebration and no streak effects
Tone	"Prayed on time", "Make up later", never "failed"	"Logged", "Rough prediction", never alarm words
Discretion	Generic notifications; streaks can be hidden	Hidden from Today by default; card can be hidden from the Domains grid; neutral notification icon (not a droplet); optional app lock with biometrics or a PIN

Calendar. Prayer shows five tier 1 anchors and soft windows in orchid. The predicted period window is a soft ruby band visible only to you, and the Period tracking layer is off in the layer chips by default.

Heatmap component. 12 px squares with 3 px gaps, 5 shades of orchid from the Prayer color, month labels on top, a Less to More legend, and a screen reader summary such as "4 of 5 prayers on this day". It is reusable for Habits and other domains later.

Privacy and safety

Prayer and Period tracking hold very personal data, so they follow the strictest rules in LifeOS.

- **Opt-in.** Both domains are off until you turn them on, and each cross-domain link has its own switch, off by default.
- **AI access.** Each domain has a separate switch for whether its content may be sent to the AI model. When it is off, the agent sees only generic time blocks, and chat commands for these domains use fixed forms (for example "period started today") handled by the app without the model.
- **Generic notifications.** Text such as "Your 6 PM reminder is ready", with a neutral icon, never the prayer name, the cycle or the flow.
- **No leaks.** Neither domain appears in weekly reviews, Reset reports, mentor prep sheets or shared exports unless you include it. The calendar band for the predicted window is shown to you only.
- **App lock.** Optional biometric or PIN lock for each of these domains.
- **Control.** Export and delete each domain on its own. Deleting also removes its data from AI memory and embeddings.
- **No advice.** The app gives no religious rulings and no medical, fertility, pregnancy or contraception advice. It shows your entries and simple averages.
- **Care.** If an entry shows serious distress or mentions self-harm, planning prompts pause and the agent responds with care and points to someone you trust or a local support line.
- **No pressure.** Missed prayers and late cycles are never shown in red or as failure; streaks can be hidden.

Build plan and document updates

Both domains belong to wave 4, the sensitive domains, so they are built after the privacy layer (opt-in switches, generic notifications, report exclusion, app lock). Adding Period tracking and the Prayer changes lengthens wave 4 from about 3 weeks to about 5, and the whole domain rollout from about 14 weeks to about 16. These are estimates for one builder.

Step	Work	Done check
1. Privacy layer	Opt-in flags, AI-sharing switches, generic notification helper, app lock, report exclusion	A sensitive domain's content never appears in another screen or report
2. Prayer update	Times grid with paste and shortcuts, windows, anchors, per-prayer check-in, statuses	Enter a week of times; five anchors appear; one check-in per prayer per day

Step	Work	Done check
3. Heatmap and stats	Reusable heatmap component, streaks, per-prayer view, Excused status	Heatmap levels match done counts; "Mark all as read" leaves answers alone
4. Period tracking core	Entries, cycles, range prediction, reminders, month strip and cycle ring	Three logged cycles give a correct range; fewer than three shows "needs more data"
5. Connections	Each link with its switch, starting with Prayer, Sleep, Mood and Medicine	A link does nothing until switched on, and shows no reason on other screens
6. Audit	Privacy, safety and edge-case tests, color neighbor test for Ruby, phone checks	All safety cases pass; no health or prayer text in notifications

Earlier documents to update for 22 domains

- **Knowledge Systems and Logic:** add Period tracking, and change Prayer to entered times with the five-prayer log.
- **Implementation Plan:** move Period tracking into wave 4 and update the roadmap totals.
- **Design Guides:** add Ruby #D6336C as the 22nd color, put Body and health at 6 domains, and add the heatmap component.
- **Overall System:** change 21 to 22 domains and add the new links.
